Advanced Medicine and Research

We recently identified Meflin as a specific marker of rCAFs in pancreatic cancer. Our studies revealed that rCAFs may represent proliferating resident fibroblasts. Using a pharmacological approach, we identified AM80, a synthetic unnatural retinoid, as a reagent that effectively converts Meflin-negative pCAFs to Meflin-positive rCAFs. We aimed to investigate the efficacy of a combination of AM80 and gemcitabine (GEM) and nab-paclitaxel (nab-PTX) in patients with advanced pancreatic cancer. We conduct research on the diagnosis and treatment of early gastrointestinal cancer, polypectomy and balloon dilation using small intestinal endoscope.

Medical Care System

Based on the treatment information and interviews with the patient and family, we evaluate the necessity, safety, and efficacy of transplantation therapy. In cooperation with the personnel in each field and with the support of transplant coordinators, we perform liver transplantation from live and brain-dead donors, establishing a lifelong medical care system for donors.
